Eduno — Lightweight, Accessible Learning Management System (LMS) for Students of UCC

Project Name	Eduno — Lightweight, Accessible Learning Management System (LMS) for Students of UCC
Company Background/Overview	The University of Caloocan City (UCC) currently relies heavily on third-party cloud tools (Google Classroom, Google Drive, Google Forms, Messenger) for lectures, assignments, quizzes, and submissions. This fragmented workflow creates inconsistency in access, discoverability of materials, and version control. The campus's existing Academic Information Management System (AIMS) handles enrollment and administrative functions but suffers from poor performance, unreliable payment reconciliation, and an outdated UI. Eduno is a student-centric, mobile-first LMS prototype focused on course content delivery, assignment submission, and basic grade/feedback workflows. It aims to reduce dependence on ad-hoc third-party channels, improve accessibility and discoverability of learning resources, and provide a cohesive, user-friendly experience for students and instructors—while intentionally not replacing core AIMS administrative functions (enrollment, payment reconciliation) unless formal integrations are approved.
Target Audience	• UCC students (all programs) who consume lectures, download resources, and submit assignments. • Course instructors who upload course materials, create assessments, and provide feedback. • Teaching assistants / course admins who grade and manage submissions. • Department staff who need exported reports of submissions and course activity.

Introduction to Human Computer Interaction

Project Objectives	● Centralize course materials, assessments, and submissions in a single, mobile-first interface that reduces reliance on multiple third-party tools. ● Deliver an accessibility-first experience (WCAG-aligned): adjustable font sizes, high-contrast mode, semantic HTML, ARIA roles, keyboard navigation, and captions for multimedia. ● Implement clear submission workflows (assignment upload, deadline handling, versioning, plagiarism flagging note) and instructor feedback mechanisms. ● Provide instructor tools for grade recording, release controls, and lightweight analytics (submission rate, late submissions). ● Support exporting of course data (CSV) for departmental reporting and archival. ● Design the system to optionally integrate with AIMS for student identity (SSO) and with existing campus file stores only if approved by university IT.
Timeline	3 months
Project Scope and Deliverables	● Course Home & Module Pages — structured course modules, resource metadata (file type, reading time, accessibility notes), and persistent search. ● Content Upload & Management — instructor interface to upload lecture notes, PDFs, slide decks, and short videos with captioning support and accessibility checklist. ● Assignment & Assessment Flow — create assignments with deadlines, submission upload (single/multiple files), versioning, and instructor feedback/comments.

	• Submission Integrity & Support — optional basic plagiarism flagging note, file-size limits, and clear error/help states for failed uploads. • Gradebook (Basic) — instructor grade entry, release controls, and student view of grades + feedback (no official transcript integration). • Notifications & Announcements — in-app notifications and optional email digests for deadlines and instructor announcements. • Accessibility Features — Accessibility Mode toggle (large fonts, high contrast, simplified layout), keyboard-only navigation, descriptive alt text, and screen-reader friendly forms. • Mobile Optimization — responsive UI optimized for smartphone use (primary student device). • Export & Reporting — CSV exports for submissions and basic course activity summaries. • User Accounts & Authentication — demo authentication (local accounts); optional SSO/LDAP integration if university IT provisions it. • Documentation & Handover — student-hosted demo, instructor guide, accessibility checklist, and recommendations for production deployment and integrations. • Usability Testing — conduct at least 5 user tests (including at least one assistive-technology user) and include findings in the case study report.
